Front Page 2000 Server Extensions

Front Page has features built in that assume the existence of a web server that has the Front Page Extensions installed. At LRCCD due to security concerns (there have been known problems with the Front Page Extensions) our servers do not run the Front Page Extensions. What this means in a practical sense at LRCCD is that when you are creating a web page with Front Page you need to make sure that you don't use any of the unsupported features. And to prevent this, it would be wise to turn off the option.

**Turning Off Front Page Server Extensions:**
Fortunately there is a way to turn the offending features off so they won't appear as options to tempt you.

1. On the Tools menu, click Page Options.
2. On the Compatibility tab, clear the Enabled with Microsoft FrontPage Server extensions check box. When editing a page in Page view, go to the Insert menu and click Component; note that you can no longer select components that rely on the FrontPage Server Extensions.

Once you have done this you don't need to worry about implementing non-standard features.
Enable only commands supported by the following:

**Browsers:**
- Custom

**Browser versions:**
- Custom

**Servers:**
- Custom

- [ ] Enabled with Microsoft FrontPage Server Extensions

**Technologies:**
- [x] ActiveX controls
